## Overview

The FSC-1 is a digital EC motor control. The control has a simple five button interface with a four digit LED display. All programmable parameters can be accessed through the user menu with the five button interface. There are two ECM connectors with modulating outputs, one 0-10V output, and one 0-10V DC input (**MUST BE ISOLATED**). The FSC-1 is compatible with Telco Green, Genteq, Nidec, and U.S. motors. User parameters are stored in non-volatile memory, and are retained even during a power outage. The FSC-1 is powered by 24V AC.

### Genteq

Genteq motors use our 0-10V output(Terminal labeled “rpm”) as the signal going to the motor. In this case, the motor selection(tyP) in the software does not matter. Be sure to select “0-10” in the “APP” parameter.

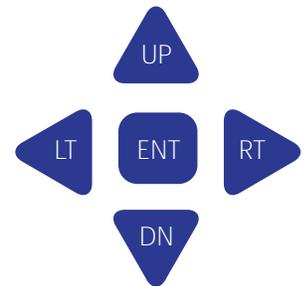

## Normal Operation

### Pulse Application

Every ten seconds the FSC-1 display will toggle between the current percent of run speed and the current RPMs. The percent of run speed can be changed by using the **UP▲** and **DN▼** keys followed by the **ENT** key to save your changes. You also have the option of using the control locally or remotely through a 10k potentiometer, 2 Speed Switch, or a 0-10V reference where 0V is 0% and 10V is 100%, unless overridden by the low speed and high speed limits. You can access programming mode by holding the enter key for three seconds.

### 0-10 Application

In the 0-10V application you are provided a programmable 0-10V reference. The display shows the selected voltage. The voltage is easily changed using the **UP▲** and **DN▼** keys followed by the **ENT** key to save your changes.

## Programming

Please refer to the “FSC-1 Menu Map” on page 3 for editing parameters within program mode. To enter program mode hold the **ENT** key for three seconds until “APPS” is displayed. Use the **UP▲** and **DN▼** keys to navigate to the desired menu parameter shown in column 1 of the menu map on page 3. To edit a menu parameter press the **RT▶** key once on the desired parameter. The current value will be displayed in column 2 of the menu map on page 3. Also use the **UP▲** and **DN▼** keys to change values within a parameter. The parameter will blink until the user presses **ENT** to save the changes or the **LT◀** key to cancel without saving. If a key is not pressed for fifteen seconds, the control will return to normal operating mode. Different parameters are as follows:

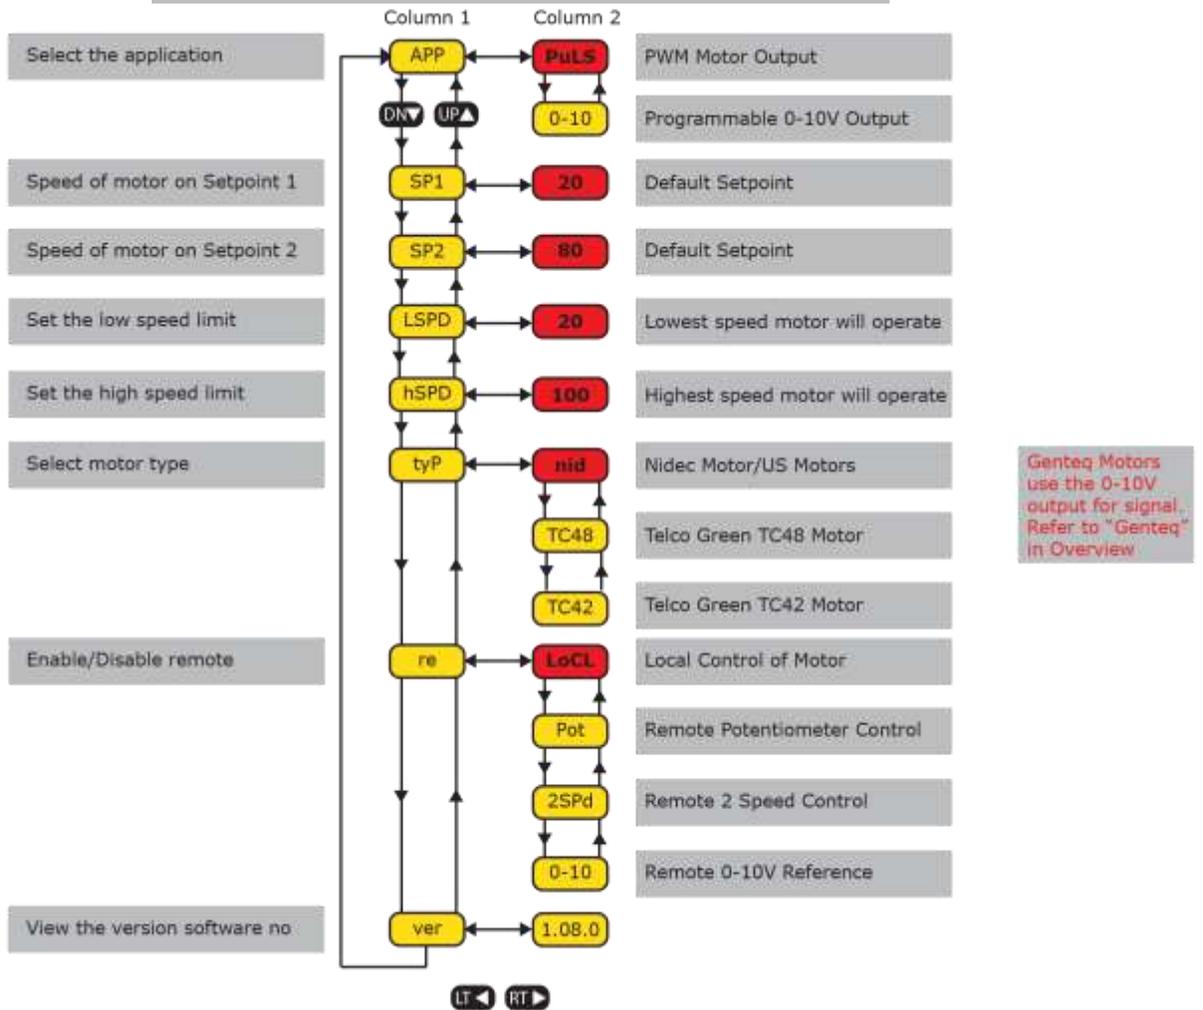

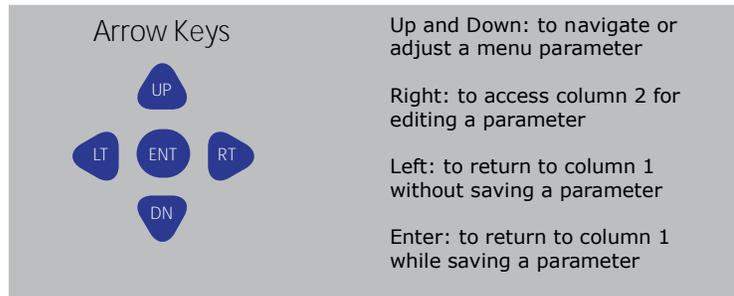

1. “APPS”: Prompts the user to select which application to utilize.
2. “SP1”: Sets the speed of the motor for Setpoint 1.
3. “SP2”: Sets the speed of the motor for Setpoint 2.
4. “LSPD”: Sets the lowest possible speed the motor will operate at. If the **DN▼** button is pressed one more time passed the “LSPD” limit, the control will turn off.
5. “hSPD”: Sets the highest possible speed the motor can operate at.
6. “tyP”: Sets the type of motor the control is configured for. The FSC-1 is compatible with Telco Green, Genteq, Nidec and US motors.
7. “re”: Selects local control or remote control type (10k Potentiometer, 2 Speed Switch or 0-10V Reference). When the 0-10V Reference(**MUST BE ISOLATED**) is utilized with Low Speed and High Speed limits, the FSC-1 will cap the percentage to what the limits are set to. So if Low Speed is set to 30%, anything up to 3 Volts will output 30%. If High Speed is set to 70%, 7 Volts and above will output 70%.
8. “ver”: Allows the user to view the current software version number.

# Alarms

Error messages on the FSC-1 will scroll across the display with a detailed message. This will help users to resolve issues faster. Possible errors are as follows:

1. "oFF"- The FSC-1 is not receiving RPM feedback.

To resolve an issue, refer to "Installation" on page 4 for proper wiring connections.

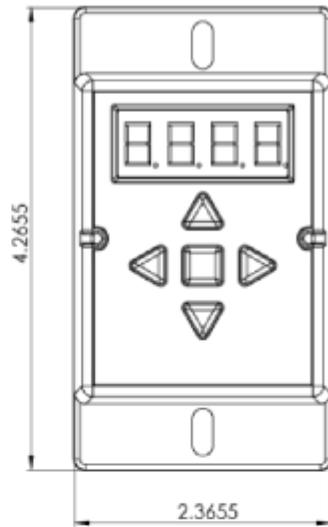

Genteq Motors use the 0-10V output for signal. Refer to "Genteq" in Overview

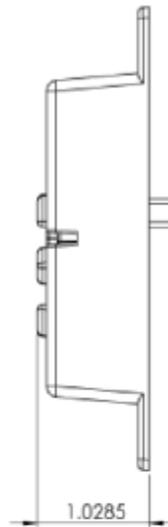

(Red indicates default parameter)
